

Chapter 1: Chemical Reactions and Equations. Chemical reactions are processes in which new substances with new properties are formed. Chemical reactions involve chemical changes. The substances which take part in a chemical reaction are called reactants. The new substances produced as a result of a chemical reaction are called products.

Chapter 2: Exothermic vs Endothermic Reactions. Exothermic reactions are chemical reactions that release energy in the form of heat, light, or sound to their surroundings. For example, respiration is an exothermic reaction, as is the burning of natural gas. In contrast, endothermic reactions are chemical reactions in which the reactants absorb heat energy from the surroundings to form products. Photosynthesis is a classic example of an endothermic reaction.
